

Handbook for the Use of Data from the Diary Study at Humboldt Universität zu Berlin

The Handbook is designed to enable third parties to use data derived from a German diary study conducted by Prof. Dr. Jaap Denissen. The diary study is a public domain content. The use of the data does not require permission or a previous request on Prof. Denissen. The only precondition for the use of the data is the co-authorship of Prof. Dr. Jaap Denissen and Dipl. Psych. Anja Kühnel.

Goal and Background

The present study is the world largest diary study. It was designed to investigate daily fluctuations in well-being and evaluate the impact of contact to and conflicts with family members, friends and partner on well-being in terms of self esteem and emotions. Additionally, variables like important life domains, goals and self perception were assessed in a certain period of the study as were variables like the weather or the amount of sleep.

Procedure

The diary study was conducted between July 2005 and April 2008. While the study was conducted 3106 valid subjects participated. Participants were acquired online through links on websites dedicated to psychological research, postings on online forums, and popular media outlets. The study consists of three parts – background questionnaire, diary questionnaire and follow-up questionnaire.

Part of the Study	Data File
Background Questionnaire	tbuch_items.sav tbuch_scales.sav
Diary Questionnaire	tbuch_days_items.sav tbuch_days_scales.sav
Follow-up Questionnaire	tbuch_items.sav tbuch_scales.sav

Tabelle 1: Mapping of the Parts of the Study and the Data Files.

The first part (background questionnaire) contains demographic data and initial questionnaires. The second part (diary questionnaire) is a daily questionnaire the participants had to fill out before going to bed or as early as possible the next day. The third part (follow-up questionnaire) was conducted after the diary study ended. In this test the participants again answered the questionnaires from the background questionnaire along with feedback questions.

Background Questionnaire

The first part of the study was designed a) to acquire demographic data from the participants like age, sex, education, etc. b) as a pre-test of medical, personality and self esteem questionnaires, and c) as a predefinition of the idiosyncratic variables which should be used in the daily questionnaires. The pre-test (b) consisted of different questionnaires. At first the subjects had to fill out a medical questionnaire followed by the Five Individual Reaction Norms Inventory - FIRNI (Denissen & Penke, in press), Big Five Inventory – BFI (John & Srivastava, 1999), and the Rosenberg Self Esteem Scale (Rosenberg, 1965). The FIRNI and BFI are personality questionnaires which assessed the participants values on the big five personality factors. In the last part (c) the participants identified the family member and friend they recently had most contact with, named their partner if they had one, and answered questions about the relation to these persons.

Some data were not collected through the whole period the study lasted. These data concerned life domains, goals, and certain self concept dimensions like civility or tolerance. The participants had to identify life domains and describe the importance of these domains for their self concept, for other persons or their well-being, etc. In the section concerning goals they had to name goals wanted to achieve and their strategies to do so along with the relevance of these goals, the motivational aspect to achieve the goals and the possible difficulties. Finally, they had to judge different self concept dimensions according to the amount with which the dimensions are present in themselves, the relevance of the dimensions for their self-perception and for others.

The questions of the tests constituting the pre-test can be seen in Tables 1.1 to 1.11.

Diary Questionnaire

The participants had to do 25 daily entries within 30 days. Therefore, they had - in-between the 30 days period - five times the possibility not to fill out the diary. They were asked to fill out the daily questionnaire before going to bed (between 8p.m. and 4 a.m.) or as early as possible the next day (until 12 a.m.).

The daily questionnaire consisted of questions concerning the amount of written, phone and face-to-face contact the participants had with their identified family member, friend and partner and with other friends and family members. For the identified family member, friend and partner they had also to answer questions about the feelings they had in the contact and which topics of conflicts may have arisen (answers via check box). Afterwards they filled out a randomised order of an emotional questionnaire, a reduced self esteem questionnaire and answered questions about the activities of the day (time doing sport,

amount of sleep, rating of routine of the day, etc.). For a certain period of the study the participants also had to answer questions concerning success and difficulties of the defined life domains (11.07.2005 – 10.01.2006) and goals along with the strategies to achieve the goals (11.07.2005 – 14.01.2008) and what kind of impression they made on others on certain self concept dimensions (29.12.2005 – 14.01.2008).

The items of the diary study and their exact formulation can be seen in Table 2.

Follow-up Questionnaire

The post-test contained the personality questionnaires from the pre-test (FIRNI, BFI) and the evaluation of the goals the participants had to name at the pre-test along with control variables like the amount of interference the study produced with the daily life. According to the fact, that the personality questionnaires (FIRNI, BFI) are the same as in the pre-test, their items are not reported again. The remaining items constituting the post-test can be seen in Tables 3.1 and 3.2.

Data files – tbuch_items.sav

The data file is derived through a syntax from the data collected online. The program generated additional variables as can be seen from Table 4.1. The raw data had to undergo data cleaning in order to work with the data files. In the course of the data cleaning some of the participants had to be excluded from both data files (tbuch and tbuch_days). These were subjects who participated twice, did not answer the questionnaires seriously but just clicked through the forms, began filling out the diary questionnaire in less than 30 days before the project ended and thus were unable to finish the study in time, or explicitly asked to be removed from the study. Along with this general criteria to remove subjects, some participants had to be removed due to special problems. These cases are documented in Table 4.2. After data cleaning the descriptive statistics for the items of the pre- and post-test were calculated and can be seen in Tables 4.3 to 4.17.

Data files – tbuch_days_items.sav

The diary entries had to undergo data cleaning as well. Removed participants and changes in the raw data are recorded in Table 5.1. After the data cleaning was completed descriptive statistics were calculated (Tables 5.2 to 5.10).

Data files – tbuch_scales.sav

After data cleaning of the items from tbuch_items.sav scales were built from the items and tbuch_scales.sav was created. Which items contributed to which scale is recorded in Table 6.1. The statistics for the resulting scales along with their reliabilities and the retest-reliabilities between pre- and post-test can be seen from Tables 6.2 to 6.4. The norms of the

scales of the used personality questionnaires, Big Five Inventory – BFI and Five Individual Reaction Norms Inventory – FIRNI, are reported in the Tables 6.5 to 6.7.

Data files – tbuch_days_scales.sav

Scales were built from the items of the diary study as well. Which items contributed to which scale is recorded in Table 7.1. Descriptive statistics and reliabilities for each scale can be seen in Tables 7.2 and 7.3.
